

CALENDAR SCREENSAVER FOR A COMPUTER DISPLAY

ABSTRACT OF THE DISCLOSURE

5 A calendar screensaver is displayed on a computer device's monitor. The process accesses the original schedule from the computer memory. The schedule, and any accompanying message, is displayed on the monitor as a screensaver while the computer device is inactive mode. If someone tries to access the calendar screensaver in order to schedule time with the workstation's owner, they have access only to the
10 schedule and not to other computer device functions. The updated schedule can then be transmitted to the workstation's owner.
